#### RoboMunch: An artist Chatbot

**Task:** You are responsible for developing a simple artist chatbot, RoboMunch, in line with the given design. Your chatbot must generate images based on the text prompts entered in the **prompt input box** after pressing **paint button**. Output image should appear in the **image output box**. User should also be able to chat with RoboMunch: Speaks out their message via **voice input button**, speech-to-text translated message should appear in the **chat input box**, and send these messages via **send message button**. RoboMunch should reply the user back, and both messages should appear in the **chat output box**.

**Hints:** Use text to image generation tools like [Stable Diffusion](#) or [Flux](#) (if your HW GPU-equipped) for image generation. Use your favorite Text Generation Inference (TGI; SmolLM2-360M-Instruct is recommended due to its lightweight) to allow for simple chatbot replies.

Demonstrate the case for, user asks a text prompt to draw from RoboMunch and then user copy/paste this prompt in the prompt input box and draw it in the image output box. Send and receive 2 rounds of messages with the bot (simple chat; send/receive/send/receive 4 requests in total at least). You can use any platform for your frontend; used web-based app is encouraged due to the alignment with the previous exercises.

**Deliverables:**

- 1) The link for your public github repository
- 2) A screen recording video demonstrating that users chat with RoboMunch and let it paint a cool digital art image.
- 3) A screen recording video explaining the code blocks used in your app.
